Wax apple

Discover

From flower to fruit

Wax apple is a tree, Syzygium samarangense.
Classification: Myrtaceae · Syzygium

Start with the tree · trunk and crown

Whole-subject illustration; not to scale

Circled area → detail at right; pruning changes the form.

Look closer · leaves, flowers and fruit

Enlarged view of the circled part; not to scale

- **Leaves:** opposite pairs
- **Flowers:** pale, with many stamens
- **Fruit:** narrow at stalk, broad below
- An evergreen tree with opposite simple leaves and flowers with many slender stamens.

What can we find today?

- Wax apple is recorded in this park
- Flowers or fruit may be absent; look at leaves
- Do not pick or taste park fruit

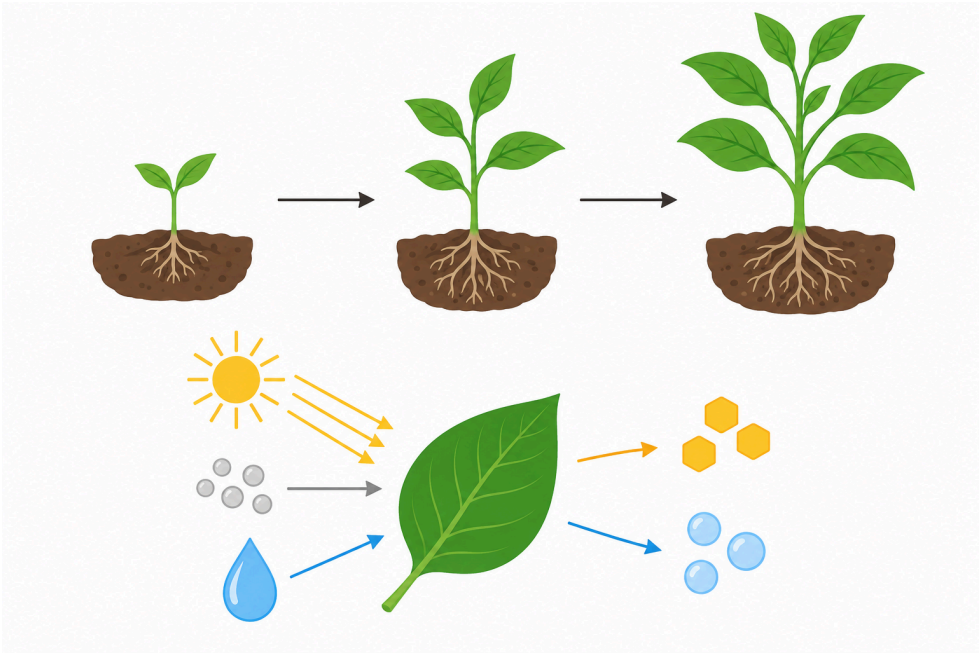

What conditions suit it?

- Warm conditions and full sun
- Moderate water and fertile loamy soil
- Notice light on the crown and the leaf arrangement

Wax apple

Discover

From seedling to tree

- Seeds need suitable conditions to sprout
- Roots and leaves grow
- Leaves use light, water and carbon dioxide
- **Grey circles:** carbon dioxide; blue drop: water
- **Gold hexagons:** sugar; blue circles: released oxygen
- **Partly known:** Growth symbols are not species forms or growth rates
- **Partly known:** Leaf sugar-making is a general plant principle

Reproduction · the seed route

Flower → **Fruit and seed** → **Germination**

- Simplified; pollination and fertilisation omitted
- Fruit colour, size and seeds can vary
- **Partly known:** One simplified route, not every individual or detail

Flowers and fruit are identification examples, not a record of one branch at one moment.
Pictures do not replace field identification. Not found and unsure are valid records.
